<b>81</b>	<b>82</b>	<b>83</b>	<b>84</b>	<b>85</b>	<b>86</b>	<b>87</b>	<b>88</b>	<b>89</b>	<b>90</b>
<b>91</b>	<b>92</b>	<b>93</b>	<b>94</b>	<b>95</b>	<b>96</b>	<b>97</b>	<b>98</b>	<b>99</b>	<b>100</b>

Using your 100 square consider the following.

Starting at 5. Count on 5. Where do you land? Keep going adding 5 what do you notice about the numbers? What is the same and what is different?

Starting at 2. Count on 10. Keep going? What do you notice? What is the same and what is different?

Using your beadstring find 62 then count on 9.

What happens? Do both digits change?

Using your speaking frame

I want to count on **9** so I counted forward **8** to reach the benchmark **70** and then **1** more. The number I counted on to is **71**.

I pick 66.

I predict that  
if I count on 9  
both digits will  
change.

Use your 100  
square and your  
beadstring to  
help you.

Do you  
agree?

I want to count on 9 so I counted forward 4  
to reach the benchmark 70 and then 5  
more. The number I counted on to is 75.

I pick 35.

I predict if I  
count on 6 both  
digits will  
change.

Use your 100  
square and your  
beadstring to  
help you.

Do you  
agree?

I want to count on \_\_\_ so I counted forward \_\_\_ to  
reach the benchmark \_\_\_ and then \_\_\_ more. The  
number I counted on to is \_\_\_.

I pick 62

I predict that  
if I count  
backwards 9  
both digits will  
change

Do you agree?

What do you  
need to do to  
be able to count  
backwards when  
you get to the  
benchmark.

What happens if you  
count back 2 or 5?

I want to count backwards \_\_\_ so I  
counted backwards \_\_\_ to reach the  
benchmark \_\_\_ and then \_\_\_ more. The  
number I counted backwards to is \_\_\_.
